Discussion.

The invention concerns a method of treatment of gas exiting the anode side of a solid oxide fuel cell stack. The essential feature is separation of carbon dioxide for disposal. According to independent claim 1, hydrogen and carbon monoxide are separated from carbon dioxide by selective membranes. According to independent claim 9, carbon dioxide are separated by cooling and condensing. In an embodiment of both of the alternative separation methods, recovered hydrogen and carbon monoxide are fed back to the fuel cell.

D1 and D2, which disclose the closest prior art, relate to treatment of gas exiting the anode side of a fuel cell. At least parts of the gas constituents are recycled and/or are otherwise used in the process. This is true also for carbon dioxide. This is different from the present invention. The difference implies an inventive step.

Consequently, the invention according to claims 1-13 is novel and involves an inventive step. Industrial applicability is shown.

D3-D5 represent the general state of the art and are not considered to be of particular relevance.

Box No. VIII Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

There are two independent claims concerning a method of treatment of gas exiting the anode side of a solid oxide fuel cell stack. According to claim 1, hydrogen and carbon monoxide are separated from carbon dioxide by selective membranes. According to claim 9, carbon dioxide is separated by cooling and condensing. It would be formally correct if said two concepts are indicated in the same claim (*i.e.* claim 1).
